

HouseHub – Your Home in a Smartphone

HouseHub is a unified digital ecosystem designed for modern residents, bringing together utility management, HOA (OSBB) interaction, and a local real estate marketplace into a single mobile application. Developed as a personal "all-in-one property manager in your pocket," the product addresses the chaos of fragmented building communications and automates daily residential routines. The app allows users to ditch dozens of outdated vendor websites, cluttered Viber/Telegram group chats, and paper receipts, providing transparent control over their living space in just a few taps

My responsibilities

- End-to-End UX/UI: Led the design process from user research to interactive mobile UI.
- UX Architecture: Created user flows and wireframes for utility dashboards and analytics.
- UI & Design System: Designed high-fidelity screens and built a scalable UI kit from scratch.
- Testing & Iteration: Refined the smart meter submission flow to minimize user errors.

Result

HouseHub successfully centralizes property management into an intuitive mobile app. Residents can now track utility data through real-time charts and submit meter readings in under a minute via photo-verification. The final product is fully ready to scale as a SaaS solution for HOAs and property management.
