

Email AI Assistant

Have you ever noticed how much hassle it takes to go through emails every day? Well, we definitely did. That’s why we’ve decided to reimagine how email providers work in order to remove all the routine work and even more.

We’ve done a meticulous research of all the possible AI features on the market and then added a hint of imagination.

My responsibilities:

- UI & Component Design: Designed custom popups, contextual menus, and interactive UI components tailored for AI-driven workflows.
- Chat Logic & UX Architecture: Structured the user flow and behavioral logic for the AI assistant chat interface to ensure smooth and intuitive user-system interaction.
- Advanced Prototyping: Built high-fidelity interactive prototypes in Figma to test complex features, micro-interactions, and edge cases.
- Motion Design & Presentations: Created dynamic animations and motion graphics for video presentations to demonstrate the product’s value and core functionality to stakeholders.
- Team Collaboration: Collaborated closely within a design team of 4, ensuring visual consistency across the entire ecosystem while owning specific functional modules.

Result

As a result we created a concept for an email provider that can detect trending topics and smart categorize your emails, customizing views based on what’s important for you, and even schedule meetings in just one click, removing a cumbersome process of checking calendars and figuring what mutual time slots would fit best for everyone.
